

# SDRHorizons™

**Put your GIS data to work where it's needed, when it's needed with SDR's Hosted Web Map Solution.**

SDRHorizons™ uses your in-house GIS data and serves it to your users via a custom web interface, accessible via a standard internet browser. Clients choose whether to offer the data to their general resident, business and government office constituency or to specific user groups via secure log-ins. Built with speed, efficiency and security in mind, SDRHorizons™ offers display, query, view and processing tools along with log-in groups to provide the right data and tools to the appropriate users—users such as your city/county clerk, county road barns, school districts, local residents, fire departments, emergency management and law enforcement officers.

## Key Features

- Uses your locally created and maintained GIS data along with publicly-available or county imagery
- Dedicated URL can be open to all or password protected
- Attribute data such as phone numbers or names can be hidden to protect privacy
- Distance and area measurement tools
- Address, road and coordinate search functions
- Full-featured map view tools including zoom, pan, previous view
- Toggle buttons to turn layers such as imagery and district boundaries on and off or make them semi-transparent
- Optional editing controls to create and maintain spatial layers such as fire hydrants or water sources
- Customizable user-input form to verify and collect data such as hazardous materials storage, emergency contact numbers or tornado shelter locations
- Select by spatial location—all homes within a mile of a wildfire, for example—and export the results to Excel.

## Requirements

SDRHorizons™ requires internet connectivity and a current, standard browser such as Firefox, Internet Explorer or Google Chrome. Map update speed is enhanced with faster connections. Dial-up connectivity is generally not adequate for web mapping applications such as SDRHorizons™. SDRHorizons™ supports GIS and imagery data in multiple formats.
